

## Testimonial

Mar 11<sup>th</sup>, 2024

There are many small holes for blood vessels to grow in, which reduces the risk of infection. The second is the displacement, it will be less displaced, it will stick firmly to your body... In my experience, after about 3 to 5 days you can remove the splint without fear of it dislodging, because it is very sticky. sure. Allows more tissue to grow, does not create a capsule, so the possibility of infection is very low.
